

Contents

List of abbreviations	7
Preface	9
1. Introduction to the issues related to tribology of human joints	11
2. Methods of imaging the shapes of the joint structures	14
2.1. Computer Tomography and the tomography of the Magnetic Resonance Imaging in the identification and three-dimensional visualisation of joint structures	17
2.2. Determination of the shape of joint surfaces using coordinate measuring technique	30
3. Surface and solid modelling of the articular structures	46
3.1. Modelling of the knee joint	47
3.2. Modelling of the talocrural joint	52
3.3. Modelling of the temporomandibular joint	57
3.4. Accuracy estimation of the shape representation of biomaterials using measurement and imaging techniques	61
4. Analysis of the surface layer of the articular cartilage using the modern microscope methods	65
4.1. Scanning tests of the cartilaginous tissue	67
4.2. Tests using the atomic force microscopy	76
5. Rheological tests of the synovial fluid	84
5.1. Rotational tests	90
5.2. Oscillatory tests	91
6. Estimation of the conditions of transfer of loadings performed by modelled joint structures using finite element method	98

7. Numerical simulations of displacements and stresses in selected human joints	119
7.1. Knee joint	119
7.2. Talocrural joint	131
7.3. Temporomandibular joint	142
8. Selection and exploitation of artificial joints in the aspect of biotribology	150
9. Analysis of the tribological phenomena in the natural bearings	162
Literature	175
