I Introduction **27**
1. Motivation 29
2. Structure of this book 31
3. State of the art 33
3.1. Inverse problems: theoretical background 33
3.2. Adaptive forward solvers 42
3.3. Inverse problems: stochastic numerical approaches 44
3.4. Inverse problems: hybrid approaches 51
3.5. Autonomous computational systems 53
3.6. Scheduling strategies in distributed environments 54
4. Open problems and main thesis 58

II Architectures and strategies for inverse problem solution **61**
5. Autonomous stochastic inverse solvers 63
5.1. Double-adaptive Hierarchic Genetic Search (*hp*-HGS) 63

5.2. Double-adaptive Hierarchic Memetic Strategy (*hp*-HMS) . . . 69
6. Autonomous scheduling system in a stochastic distributed environment . . . 79
6.1. Considered architecture of a computing multi-agent system . . . 79
6.2. Diffusive scheduling strategy . . . 81
7. Case studies: problem statements and theoretical results . . . 84
7.1. 3D resistivity logging measurements: DC antennae . . . 84
7.2. 3D resistivity logging measurements: AC antennae . . . 94
7.3. Magnetotelluric measurements . . . 103
7.4. Step-and-Flash Imprint Lithography . . . 108
8. Experiments . . . 113
8.1. Benchmark tests . . . 113
8.2. Inversion of DC measurements . . . 117
8.3. Inversion of AC measurements . . . 122
8.4. Inversion of MT measurements . . . 130
8.5. Inversion of MT measurements: twin-objective case . . . 132
8.6. Young moduli identification in SFIL process . . . 135
8.7. Diffusive scheduling experiments . . . 141
9. Summary . . . 148

III Asymptotic behavior and concurrency in stochastic strategies 149
10. Action concurrency and asymptotic guarantee of success in multi-deme memetic strategies . . . 151
10.1. System architecture . . . 151
10.2. Action categories . . . 157
10.3. Agent-based management . . . 159
10.4. System dynamics . . . 161
10.5. Sample actions . . . 164
10.6. Asymptotic features . . . 165
10.7. Extension to continuous state space . . . 167
11. Island model as an ergodic Markov chain . . . 170
11.1. Single-population succession schemes . . . 170
11.2. Multi-population sampling measures . . . 172

11.3. Migration with common selection 173
11.4. Agent-based synchronization 178
11.5. Stochastic system evolution 182
12. Stochastic dynamics of Hierarchic Genetic Search 185
12.1. Efficiency stopping condition 185
12.2. Model foundations 186
12.3. System states 188
12.4. Agent-based synchronization 190
12.5. Stochastic operators associated to the agent actions 194
12.6. Global dynamics 197
13. Heuristic operator in multi-objective evolutionary algorithms 202
13.1. Preliminaries 202
13.2. Selection operator 205
13.3. Heuristic 206
13.4. Asymptotic behavior 207
14. Existence and characterization of optimal scheduling in autonomous stochastic environments 209
14.1. A formal model of computational multi-agent systems 209
14.2. Optimal scheduling problem 218
15. Summary 222

Final remarks **225**
16. Summary of all the achieved goals 227
17. Conclusions and future works 229

Appendices **231**
A. AC, DC and MT problems: theoretical details 233
A.1. Propagation of electromagnetic waves 233
A.2. Ground layer resistivity problem: AC antennae 236
A.3. Ground layer resistivity problem: DC antennae 243
A.4. Ground layer resistivity problem: MT measurements 248
B. Mathematical details of the SFIL problem 250
B.1. Forward problem and energy functional 250

B.2. Linear elasticity model with thermal expansion coefficient 251
C. EMAS model details and extensions 253
C.1. Proof of the commutativity of local actions: discrete case 253
C.2. EMAS action details 254
C.3. Proof of the commutativity of local actions: continuous case 260
Bibliography 263
